Index Number - MSC/GR/2012040

**Thesis Submitted to the University of Sri Jayewardenepura for  
award of the Degree of Master of Science in Geographic  
Information Systems and Remote Sensing on 15.06.2014.**

### **DECLARATION OF THE CANDIDATE**

The work described in this thesis was carried out by me under the supervision of Ven. Dr. Pinnawala Sangasumana and Mr. Shivanandaraja and a report on this not been submitted in whole or in part to any university or any other institution for another Degree/Diploma.

Signature of the Candidate

01/08/2014

Date

## **DECLARATION OF THE SUPERVISORS**

We certify that the above statement made by the candidate is true and that this thesis is suitable for submission to the University for the purpose of evaluation.

NIR	-	Near Infrared
IDW	-	Inverse Distance Weighted

## **Acknowledgement**

I would like to express my especial thanks and sincere gratitude to my supervisors, Dr. Pinnawala Sangasumana (Head/Geography, Coordinator- M.Sc. in GIS & RS ), Academic staff of M.Sc. in GIS & RS and Mr S Shivanandaraja, Academic staff of M.Sc. in GIS & RS for their invaluable guidance, encouragements, patience and precious time that he offered to me. And, I was guided step by step from the beginning and I am deeply impressed with his wealth of knowledge and dedication to academic research.

I thank prof. Krishan Deheragoda who motivated me towards this endeavour by extending his valuable guidance during reviews from the inception.

## **ABSTRACT**

The land accesses to Sri Lanka after the end of 30 years long civil war has increased the need of regularly update land cover/land use information for proper planning.

This research study was initiated with the main objectives of land use change past 35 years in Ampara district presenting a methodology though utilizing remote sensing imagery, GIS approach and social and environmental factors for simulating land use change. 13 year land sat imageries of Ampara District with 35 year time intervals and user social and environmental changes have been employed in order to simulate land use change. All images were rectified and registered to Sri Lanka grid system. Normalized vegetation index was used to classify the images to different land use categories. Seven classes were identified. GIS is used to model and monitor land use and perform spatial analysis on the results. This research adapts land use change model parameterized for Ampara district and explores how factors such as soil, rain fed, tanks and irrigation system can influence it. For each cell in the study area, the real change between two time steps is determined and analyzed compared with the provided variables in order to produce probability of land use change layer.

Those factors are acquired from remote sensing technologies and GIS analysis. Through remote sensing image impact factors (terrain) and socio-economic impact factors (town scale the distance from the town and main road) the population on the grid is discrete by spatial analysis functions of GIS. Through analyzing the various factors which impact on land suitability and the distribution of population, we determine the weight of the various factors which impact on the change land use pattern, evaluate the land use suitability to determine the direction of agriculture. These provide the scientific basis for planning.
